

# NEW CANAL SEALING TECHNOLOGY

THE  
ECONOMICAL  
ALTERNATIVE!

Are you tired of spending thousands of dollars to seal your canals?

Are you searching for an economical way to help stop your canal leakage and seepage.

Are you looking for a solution that really works?

Then look inside to find out how you can seal your canal leaks effectively and economically.

# CANAL SEAL

# NEW CANAL SEALING TECHNOLOGY

## STOP WASTING WATER!

**CANAL SEAL** is a new liquid formulation of Anionic Polyacrylamide that creates a negative charge which attracts the suspended sediment in the water. The sediment drops to the bottom of the canal and seals existing leaks.

**CANAL SEAL** can be applied as is without the addition of water directly to the dry canal bed just prior to water flow. In most cases, up to a 90% seal can be attained for less than \$0.004 per square foot.

**CANAL SEAL** requires no expensive modification to your application equipment.

## KEYS TO SUCCESS:

1. Always use 4-6 gallons per treated acre.
2. Don't worry if your sprayer is not able to "broadcast spray" normally with 100% coverage. **CANAL SEAL** will rapidly dissolve in the water stream and finish dispersing over the entire canal bed.
3. Do not apply more than a few days prior to initial water flow.
4. Be sure the initial water flow contains suspended sediment. It won't work without it!
5. Remove all screens and purge pump and lines with crop oil before application.

**CANAL SEAL** degrades when exposed to sunlight. If the canal is kept filled with water, the degradation will be slowed so it is our belief **CANAL SEAL** should last the entire summer. In most cases **CANAL SEAL** should be reapplied each spring.

**CANAL SEAL** is specifically formulated for canal sealing and is only available from American Soil Technologies, Inc.

Don't miss out on the newest breakthrough in years to help you manage your water and reduce loss due to leakage and seepage.
